July 30, 2026

Dear Solactive Team,

I am writing to apply for the Intern position in Complex Markets Solutions. I am a Data Science student at Tecnológico de Monterrey, and I am drawn to this role because it sits exactly where I want to be: close to financial markets data, using Python and SQL to keep operational processes for index products correct and auditable.

Most of my recent work has been about making financial data trustworthy at scale, which maps directly onto daily index operations and governance:

- Automating financial data processes: At Deutsche Bundesbank (AnaCredit), I converted a case-by-case validation script into a parameterized Python/SQL framework, applicable across databases, attributes, and reporting periods without rewriting logic each time.
- Quantitative rigor: My research in lattice-based cryptography involved analyzing algorithmic complexity and security parameters, the kind of precise, assumption-checking thinking that quantitative index products also demand.
- Governance and documentation: I built a fully auditable data-cleaning pipeline for simulated banking data, logging every change with the reasoning behind it, so a decision could always be traced back to its source.

I have not worked with index products specifically, but the underlying discipline, keeping operational data reconciled and processes transparent under real deadlines, is what I have practiced this year in a regulated financial environment. I am available from around August 2026 for approximately six months, alongside the final stretch of my degree (expected 01/2027).

I would welcome the opportunity to discuss how I can contribute to the Complex Markets Solutions team.

Kind regards,

Ana Lorena Ortiz Loyola
