Dear Westinghouse GRO Team,

I am writing to apply for the Data Analytics and Reporting internship within Governance, Risk, and Opportunities. I am a Data Science student at Tecnológico de Monterrey, and what stood out to me in this posting is the core task: collecting, validating, and reconciling data across systems into reporting that people can act on, which is precisely what I have spent the past months doing in a regulated environment.

My experience maps directly onto this role's data-validation and reporting focus:

- Validating and reconciling data: At Deutsche Bundesbank (AnaCredit), I built automated Python/Pandas tests checking row counts, referential integrity, and aggregate consistency across systems, catching duplicate entries and value-range violations before they reached a decision.
- Documenting and improving workflows: I converted a case-by-case validation script into a parameterized, configuration-driven solution, and paired it with automated ticketing so findings reached the right stakeholders without manual follow-up.
- Reporting for governance: My personal data-pipeline project builds a fully auditable log of every change made to a dataset, alongside structured visual reports, the same instinct this role asks for around risk and KPI tracking.

I have not worked in the nuclear or engineering sector specifically, and my Power BI experience is still developing (I currently work with Tableau, Matplotlib, and Seaborn), but I pick up new BI tooling quickly and the underlying discipline, turning validated data into a report someone can rely on, is what I already practice daily. I am fluent in English and German (C1), and available for an internship of six months or more.

I would welcome the opportunity to discuss how I can contribute to the GRO team.

Kind regards,

Ana Lorena Ortiz Loyola
