Dear 1KOMMA5° Team,

I am writing to apply for the Working Student Energy Data Analyst role on the Tech-Product team. I am a Data Science student at Tecnológico de Monterrey, and I am drawn to this role because it puts SQL and Python analysis directly in service of the energy transition, a domain where a correct number in a report has real consequences for a household's savings estimate.

Most of my hands-on experience comes from working with data I did not generate myself and could not simply trust at face value, which is exactly the discipline this role asks for when assessing customer savings or load performance:

- Validating data before drawing conclusions: At Deutsche Bundesbank (AnaCredit), I built automated Python/Pandas tests checking row counts, referential integrity, and aggregate consistency on regulatory data reported by external banks, catching duplicate entries and value-range violations before they reached a decision.
- Turning analysis into a clear, structured story: I designed automated error detection with ticketing and stakeholder notifications, so technical and non-technical colleagues alike could act on the findings without re-deriving them.
- Independent, end-to-end ownership: In a personal project I built a full pipeline for simulated bank transactions, from a normalized SQLite database through staged cleaning to a structured exception report, using Claude Code as an AI coding assistant throughout.

I have not worked in the energy sector specifically, but the underlying task, evaluating potential savings and market developments from imperfect real-world data, maps closely onto what I did with banking data this year. I am fluent in English and German (C1), available for 20 hours per week alongside my studies, and comfortable working remotely with a distributed team.

I would welcome the opportunity to discuss how I can contribute to the Tech-Product team.

Kind regards,

Ana Lorena Ortiz Loyola
